ICC EVALUATION SERVICE®

ICC-ES Evaluation Report

ESR-4009

Reissued November 2020

This report is subject to renewal November 2021.

www.icc-es.org | (800) 423-6587 | (562) 699-0543 *A Subsidiary of the International Code Council®*

DIVISION: 05 00 00—METALS
Section: 05 05 23—Metal Fastenings

REPORT HOLDER:

EJOT FASTENING SYSTEMS L.P.

EVALUATION SUBJECT:

EJOT SUPER-SAPHIR® JT3 AND EJOFAST® JF3 SCREWS

1.0 EVALUATION SCOPE

Compliance with the following codes:

- 2018, 2015, 2012 and 2009 *International Building Code®* (IBC)
- 2018, 2015, 2012 and 2009 *International Residential Code®* (IRC)

Properties evaluated:

- Fastener shear and tension strength
- Pull-out strength

2.0 USES

EJOT Super-SAPHIR® JT3 and EJOFAST® JF3 screws are used to connect miscellaneous building materials to steel base material. For structures regulated under the IRC, the screws may be used when an engineered design is submitted in accordance with IRC Section R301.1.3.

3.0 DESCRIPTION

3.1 General:

The EJOT Super-SAPHIR® JT3 and EJOFAST® JF3 screws are bi-metal screws consisting of a hardened carbon steel tip welded to a stainless steel body. Screws with a designation such as "E16" in the metric product designation or "S$^{5}/_{8}$" in the standard product designation have a premounted, stainless steel bonded EPDM rubber sealing washer. The screws are available in multiple lengths, some of which are partially threaded.

3.2 Super-SAPHIR® JT3 Screws:

The Super-SAPHIR® JT3 screws have a self-drilling point. Several families of JT3 screws are available with different head styles and drilling points. See Table 1 for descriptions of these screw families, including intended uses, dimensions, drilling capacities and figure references.

3.3 EJOFAST® JF3 Screws:

The EJOFAST® JF3 screws have a hex washer head or a truss head and a self-piercing point. See Table 2 for descriptions of these screw families, including intended uses, dimensions, drilling capacities and figure references.

3.4 Screw Material:

The EJOT Super-SAPHIR® JT3 and EJOFAST® JF3 bi-metal screws consist of a hardened carbon steel drilling or piercing tip welded to a stainless steel body. The stainless steel conforms to DIN EN ISO 3506. The carbon steel tip is made from steel conforming to DIN EN 10263-4 and hardened, with a minimum surface hardness of 580 HV. The screws have a zinc coating to protect the carbon steel drill tip. When tested for corrosion resistance in accordance with ASTM B117, the screws show no white corrosion after three hours and no red rust after 12 hours.

3.5 Steel Base Material Requirements:

Steel base material must have thicknesses and minimum tensile strengths as indicated in Table 4, as applicable.

4.0 DESIGN AND INSTALLATION

4.1 Design:

4.1.1 General: The design values in this report are intended to aid the designer in meeting the requirements of IBC Section 1604.2. Determination of the suitability of a particular screw recognized in this report for the specific application is the responsibility of the registered design professional and is outside of the scope of this report. The registered design professional is responsible for determining the available strengths for the connection, considering all applicable limit states such as pull-over or pull-through and tilting and bearing, and for considering serviceability issues, such as fastener slip. The registered design professional is responsible for determining the required spacing, edge distance and end distance for the fasteners, based on the characteristics of the steel base material and the attached building material.

4.1.2 Fastener Shear and Tensile Strengths: The EJOT Super-SAPHIR® JT3 and EJOFAST® JF3 screws have the fastener strengths shown in Table 3.

4.1.3 Pull-out Strength: Available pull-out strengths for EJOT Super-SAPHIR® JT3 and EJOFAST® JF3 screws installed into steel base material have been determined by testing and are shown in Table 4.

4.2 Installation:

Installation of EJOT self-drilling tapping screws must be in accordance with the report holder's published installation

ICC-ES Evaluation Reports are not to be construed as representing aesthetics or any other attributes not specifically addressed, nor are they to be construed as an endorsement of the subject of the report or a recommendation for its use. There is no warranty by ICC Evaluation Service, LLC, express or implied, as to any finding or other matter in this report, or as to any product covered by the report.

instructions and this report. The report holder's published installation instructions must be available at the jobsite at all times during installation.

The screws must be installed perpendicular to the work surface, using a variable speed screw driving tool set to not exceed 1,800 rpm.

Screw length must be adequate to accommodate the thickness of the connected building material, the thickness of the steel base material and the minimum required protrusion past the back side of the supporting steel base material. The minimum required protrusion dimensions are shown in Tables 1 and 2. The screw point style must be selected on the basis of the qualified drilling/piercing capacity, which is shown in Table 1 or 2, as applicable. The tabulated drilling/piercing capacity refers to the thickness of the supporting steel member. Evaluation of the ability of the screw to self-drill or self-pierce through the attached building material and then into the steel base material is outside the scope of this report.

The required edge distance, end distance and spacing for the attached building material are outside the scope of this report. For the supporting steel base material, screws must be spaced a minimum of three times the nominal diameter of the screw and must be located not less than 1.5 times the diameter of the screw from any end or edge of the steel base material.

5.0 CONDITIONS OF USE

The EJOT Super-SAPHIR® JT3 and EJOFAST® JF3 screws described in this report comply with, or are suitable alternatives to what is specified in, those codes listed in Section 1.0 of this report, subject to the following conditions:

5.1 Fasteners must be installed in accordance with the report holder's published installation instructions, this report and the approved plans. In the event of a conflict between this report and the report holder's published installation instructions, the more restrictive requirements govern.

5.2 The screws have only been evaluated for fastener shear and tension strength, pull-out strength and manufacturing quality control. Evaluation of other applicable limit states for connections of building materials to the steel base material is outside the scope of this report.

5.3 Design of the connection of attached material to the steel base material, taking into account the properties of the attached material, must comply with the applicable requirements of the IBC, and be justified to the satisfaction of the code official.

5.4 The screws may be used in structures regulated under the IRC when an engineered design is submitted for review in accordance with IBC Section R301.1.3.

5.5 The screws are manufactured under a quality control program with inspections by ICC-ES.

6.0 EVIDENCE SUBMITTED

Data in accordance with the ICC-ES Acceptance Criteria for Self-drilling Tapping Screws Used to Attach Miscellaneous Building Materials to Steel Base Material (AC500), dated October 2017 (editorially revised December 2017).

7.0 IDENTIFICATION

7.1 The heads of the EJOT Super-SAPHIR® JT3 and EJOFAST® JF3 screws are stamped with "J3", as shown in the figures in this report. Each container of fasteners has a label bearing the company name (EJOT), fastener description (family designation, diameter, length, and washer size, as applicable), and the evaluation report number (ESR-4009).

7.2 The report holder's contact information is the following:

JT3-18-5,5	#12-14	0.216	#7						376	664	1,055	1,217
JF3-2H-5,5 JF3-FR-2-5,5	#12 - 18	0.216	n/a	91	160	193						

For **SI:** 1 inch = 25.4 mm, 1 lbf = 4.4 N, 1 ksi = 6.89 MPa.

[1]Values are based on steel members with having a minimum tensile strength of F_u = 45 ksi for thicknesses from 0.018 to 0.118 inch, or having a minimum tensile strength of F_u = 58 ksi for thicknesses of 0.125 inch and 0.250 inch.
